

EDUVEERA

FINAL DEVELOPER MVP BRIEF — PAPERLESS REGISTRY TOOLS

Purpose: Existing Eduveera website par low-cost working MVP live karna hai. Approx development budget ₹2,000–₹3,000. Focus only on core working features.

1. Core Tools to Build

Tool	Required functionality
Image Compressor	Upload image → choose target (especially <100 KB) → compress → show final KB → download.
Passport Photo	Upload → crop/zoom/reposition → fixed passport-style output → JPG download.
Hindi Converter	Unicode ↔ Kruti Dev conversion. Architecture future mappings ke liye modular ho.
Smart Detection	Pasted text ko Unicode vs supported legacy/ASCII-style pattern ke basis par identify karna.

2. MOST IMPORTANT — Hindi / ASCII / Legacy Conversion

Generic converters often fail on legacy/ASCII-style Hindi text. Build around known legacy font mappings and Hindi reordering rules.

- Kruti Dev → Unicode.
- Unicode → Kruti Dev.
- Do not treat arbitrary ASCII as a Hindi encoding; support known legacy mappings/patterns.
- Keep mapping tables modular for future fonts.
- Test using real deed samples: matras, half letters, conjuncts, punctuation, numbers and mixed Hindi/English.

3. Image Compressor

- Presets: Under 100 KB, Under 50 KB, Under 30 KB and Custom.
- Show original and final size.
- Prefer client-side processing where practical.
- Must work smoothly on mobile.

4. Passport Photo

- Upload → crop/zoom/reposition → fixed passport-style ratio/size → JPG download.
- Keep Day-1 implementation simple; AI background removal is not required.
- Architecture should allow future A4 multi-copy sheet.

5. Credit System

Backend structure abhi se proper rakhein, lekin MVP payment flow simple rakha ja sakta hai.

- Each user: user_id + credit_balance.
- Every credit addition/deduction creates a transaction record.
- Successful tool action deducts credits; failed processing does not.
- Admin can add/remove credits.
- Pricing must be configurable, not hard-coded.

6. Payment — MVP

Preferred: Indian payment gateway such as Razorpay. If integration delays the MVP, use manual UPI + UTR approval first.

- User selects credit pack.
- Payment/UTR linked to user.
- Admin can approve/reject.
- Approved payment adds credits and creates transaction.
- Later gateway webhook can automate verification.
- Credits must only change server-side.

7. Basic Admin Panel

- Admin login.
- Search/view users.
- View balance.
- Add/remove credits.
- View transaction history.
- View pending UTR/payment requests.
- Basic tool-usage count.

8. Minimum Database Structure

users	id, name/email/phone, created_at, status
credits	user_id, balance
credit_transactions	id, user_id, type, amount, reason, reference, created_at
payments	id, user_id, amount, UTR/payment_id, status, created_at
tool_usage	id, user_id, tool, status, created_at

9. UI / UX

- Mobile-first.
- Clear tool cards/buttons.
- Minimal steps: upload/paste → process → download.
- Hindi + English friendly labels.
- Clear processing and error messages.

10. Security & Privacy

- Validate uploads and file types.
- Protect admin routes and credit APIs.
- Use HTTPS.
- Do not publicly expose user files.
- Do not retain photos/documents unnecessarily.

11. Web Development Scope — MVP Only

Developer ka current assignment sirf website development aur above listed MVP functionality ko live karna hai. Neeche ke features is scope mein include nahi hain:

- Native Android/iOS application.
- Advanced PDF editor.
- AI face detection or AI background removal.
- Large-scale analytics/reporting system.

- Referral/affiliate system.
- Complex subscription/billing management.
- Multi-language expansion beyond the agreed UI.
- Additional tools or features not listed in this brief without prior approval.

12. Acceptance Test / Handover

- Photo successfully compressed below 100 KB.
- Passport photo generated and downloaded.
- Kruti Dev ↔ Unicode conversion demonstrated on real deed text.
- Legacy/ASCII-style sample tested.
- Credit deduction/addition works correctly.
- Admin can manually adjust credits.
- Payment/UTR flow works if included.
- Source code, database/schema, admin access and deployment access handed over.

Developer instruction: Working functionality and accurate Hindi conversion are more important than visual polish. Keep code modular and maintainable for future development.
